

Acoustic Art Set-Up **VIBRATRON**

Mount your Vibratron on the front wall behind your main speakers approximately 3 to 5 feet above the floor using one of the supplied screws for either drywall or hard surface. You may also use the Vibratron Stand (not included). If a painting, video screen or other object prevents you from using this location, mount the Vibratron below the obstruction but as close to the ideal location as possible. You can then place a Gravitrone Satellite above the obstruction to approximate the ideal Vibratron placement. This will raise vertical image placement to natural levels and smooth out high frequencies in your system.

Specially developed mid-range tuning magnets are included to help integrate the Vibratron with your room. Try experimenting by placing all of the magnets atop the Vibratron for a noticeable increase mid-range liquidity and warmth, then remove them and listen for a lift in high frequency extension. Finally, experiment with different combinations of large gold magnets and smaller silver magnets until your desired combination is found.
